on Mar 21, 2002 this sequence version replaced gi:1759431.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plaamid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em:, EMBL; Sw:,
SWISSPROT; TE:, TREMEL, WORMERP; Information on the WORMERP
database can be found at

The present invention describes detecting nucleotide triplet repeats in a region of human chromosome 18q disposed between polymorphic markers 25 D18668 and D18579 to identify a human gene associated with a mood disorder or related disorder. AAX88542 to AAX88705 represents human chromosome 18q YAC clones and primers corresponding to them, used in the exemplification of the present invention. YAC clones comprising a portion of the region of human chromosome 18q between markers D1868 and D185379 are used to identify at least one human gene associated with a mood disorder or related disorder. The mood disorder or related disorder. The mood disorder or related disorder. The mood disorder or related disorder. This includes mood disorders (296.XX, 300.4, 311, 301, 13, 295.70), schizophrenia and related disorders (295. 297.1, 298.9, 297.3, 298.9), anxiety disorders (300.XX, 309.81, 308.3), adjustment disorders (309.XX) and personality disorders (codes 301.XX). Probes derived from genes associated with the mood disorder or related disorder can be used to detect pathological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are
                                                                                                                                                                                                                                                                                                                                                                                                                                          mutations or genetic variations in patients. The methods, probes and antibodies can be used to determine the susceptibility of an individual to a mood disorder or related disorder. The nucleic acids and proteins of the human gene can be used to treat mood disorders and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polynucleotides encoding human secreted proteins - derived from e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Expressed sequence tag; secreted protein; haematopoiesis regulator; tissue growth; activin; inhibin; tumour invasion suppressor; EST; hchemotaxis; chemokinesis; haemostasis; gene therapy; thrombolysis; receptor; ligand; anti-inflammatory; tumour inhibitor; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       δŏ
                                                                                                          The present invention describes detecting nucleotide triplet repeats in a region of human chromosome 18q disposed between polymorphic markers bl8568 and b188979 to identify a human gene associated with a mood disorder or related disorder. AAX88542 to AAX88705 represents human chromosome 18q TAC clones and primers corresponding to them, used in the exemplification of the present invention. TAC clones comprising an option of the region of human chromosome 18q between markers D18568 and portion of the region of human chromosome 18q between markers D18568 and clisty are used to identify at least one human gene associated with a mood disorder. is chosen from the Diagnostic and Statistical Manual of Mental Clistycer, version 4 (DSM-IV) taxonomy. This includes mood disorders (296.XX, 300.4, 311, 301, 13, 295.70), schizophrenia and related clistycers (296.XX, 300.4, 311, 301, 13, 295.70), schizophrenia and related clistycers (codes 301.XX). Probes derived from qenes associated with the mood clistorder or related disorder can be used to detect pathological antibodies can be used to determine the susceptibility of an individual condition and person or related disorder. The mood disorders and related disorder of related misorder. The mood disorders and related disorder. The nucleic acids and proteins and related disorder. The nucleic acids and proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          6

                                                                                                                                                                                                                                                                                                                                  8-JUN-1
   all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopoiesis regulating activity, tissue growth activity, activity, activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                    ..

These sequences peptidases genes HII-3, 2 and 1 respectively. These sequences encode HIIOD which is a protein doublet which shows homolyy to a family of integral membrane aminopeptidases. The differences between these coding sequences can be attributed to different mRNAs of the multigene family, and also to different variants of the HIIOD-cycle, or in strains differing in geographical origin. Antigenic fragments of the aminopeptidases encoded by these sequences may be used in vaccines to stimulate immans. These DNA sequences may be incorporated into a virus or microbe and used in a similar manner.

                    antidiabetic; hypotensive, dermatological; immunosuppressive; antinhammatory; antibacterial; antiviral; antinhammatic; antithammatory; antibacterial; antiviral; antichnamic; antithemmatic; antithrough and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an OREX-associated disorder. The notation can be used to express OREX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, profit short disease, cardiovascular disease, diabetes mellitus. Appertension, hypothyroidism, cholesterol ester storage, systemic lupus crythematosus, severe combined immunodeficiency (SCID), AIDS, viral, acterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemodylobinuria, antinflammatory disease; to enhance coagulation, to inhibit thrombosis; and as a contraceptive.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAQ52498-99 represent cDNA clones of the helminth aminopeptidase gene H11-1. H11-1 encodes H110D which is a protein doublet which shows homolgy to a family of integral membrane aminopeptidases. The differences between these coding sequences can be attributed to different mRNAs of the multigene family, and also to different variants of the H110D-encoding sequence being present at different stages of the life cycle, or in strains differing in

The present invention provides the protein and coding sequences of the human 07G627 oncogene. This gene is found at the HPC1 region of circonosome 1. The sequences can be used in the diagnosis and identification of treatments for prostate cancer. The present sequence is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The sequences given in AAQ52500-02 represent the helminth aminopeptidase genes H11-1, -2 and -3 respectively. These sequences encode H110 which is a protein doublet which shows homolypy to a family of integral membrane aminopeptidases. The differences between these coding sequences can be attributed to different mRNAs of the multigene family, and also to different variants of the H1100-ording sequence being present at different stages of the H1100-ordin strains differing in geographical origin. Antigenic fragments of the aminopeptidases encoded by these sequences may be used in vaccines to stimulate immunes response against helminth parasites in humans or other animals. These DNA sequences may be incorporated into a virus or microbe and used in a similar manner.

The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Albrimer's disease, AlbS, epllepsy, neurofibromatosis, rhemmatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ; expressed sequence tag; secreted protein; cDNA isolation; chromosome mapping; ss.
                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal cytosine methylation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, AlDS, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/alcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid comprising fragment of chemically modified gene, useful for diagnosis and treatment of diseases associated with abnormal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       8-JUN-1999
                                                                                                                                                                                                             24 - MAY - 1
       The present sequence is one of a large number of 5' ESTS derived from mans, encoding secreted proteins. No ORF has yet been conclusively identified within the present sequence. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. ESTS sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTS are not well suited for isolating cDNA sequences have been obtained, the full 5' UTR is rarely included. S' ESTS are derived from RNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTS are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

(I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                     Human, prostate cancer; cytostatic; carcinogen; pharmacodyanamic marker; pharmacogenomic marker; gene; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer, stage of prostate cancer -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Description

Sequence 80, Application US/09270542

Patent No. 6322976

GREREAL INFORMATION:
APPLICANT: Altuman, Timothy
APPLICANT: Stanton, Lawrence
TITLE OF INVENTION: Compositions and Methods of Disease Diagnosis and
TITLE OF INVENTION: Therapy
FILE REFERENCE: 4198/78179

CURRENT FILING TOWINGER: US/09/270,542

CURRENT FILING DATE: 1999-31-17

EARLIER PILING DATE: 1999-12-23

NUMBER OF SEQ ID NOS: 207

SEQ ID NOS: 207
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                US-09-270-542-91/C

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              KENOLITY

Sequence 12, Application US/08405271A

Sequence 12, Application US/08405271A

Patent No. 643262

Patent No. 643262

PAPLICANT: EVANS, CHRISTOPHER J.

APPLICANT: OPIOID RECEPTOR GENES

NUMBER OF SEQUENCES: 25

COUNTRY: WARAINGTON & FORESTER

STATE: DC

COUNTRY: USA

CONPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER READABLE FORM:

/tissue_trope="mixture of effective nodules from 40 day old
plants harvested 36 hours post shoot removal and nodules
collected from 2 month old plants at mid-pod stage"
/lab_host="E. coll strain SOLR" site_1: EcoRI; Site_2:
/hot="Vector: pBluescript SK +/-: Site_1: EcoRI; Site_2:
/hot; CDNA was prepared from polyA+ enriched RNA from the
mixture of effective nodules of 40 day old plants
harvested 36 hours post shoot removal and nodules
collected from 2 month old plants at mid-pod stage. The
cDNA was directionally ligated into the Uni-ZAP XR vector
from Stratagene and packaged using Gigapack III Gold
packaging extracts. Plasmids containing CDNA inserts were
excised from the recombinant lambda-ZAP phage using
Ex-Assist helper phage and propagated in SOLR cells."
